

Project Design Phase
Proposed Solution Template

Date	30 June 2026
Team ID	
Project Name	Comprehensive Analysis and Dietary Strategies with Tableau: A College Food Choices Case Study
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	College students face an invisible struggle where demanding academic schedules, exam stress, and low nutrition awareness lead to unhealthy habits like skipping breakfast and overconsuming fast food. This negatively impacts their energy, focus, and academic productivity. Concurrently, campus cafeteria managers lack data-driven, empirical insights into student eating patterns, preventing them from designing optimized, healthy menu options that students will actually buy.
2.	Idea / Solution description	The solution is a suite of interactive Tableau data visualization dashboards built on student dietary survey data. It bridges the gap between subjective lifestyle choices and tangible performance trends. For students, the platform acts as an educational, analytical narrative linking specific choices (like eating breakfast) to higher mental focus. For university stakeholders and cafeteria managers, it translates complex datasets into clear, actionable trends, empowering them to restructure menu designs (e.g., introducing fresh salad bars and balanced meal combos) based on verified campus demand.
3.	Novelty / Uniqueness	Unlike generic health flyers or static nutritional apps, this solution leverages hyper-local campus data and high-fidelity, interactive dashboards. It utilizes multi-dimensional data mapping—correlating dietary behavior directly with psychological triggers (stress/boredom) and performance outcomes (concentration). This replaces passive, generalized health advice with an active, data-driven framework where campus food supply directly reacts to localized consumer demand.

4.	Social Impact / Customer Satisfaction	* For Students: Drives behavioral shifts that reduce mid-lecture fatigue, improves overall health, and optimizes academic focus through active self-awareness. * For the Institution: Fosters a healthier, more vibrant campus culture. * For Cafeteria Operations: Enhances student satisfaction by offering targeted, highly desired, and nutritional food choices, drastically reducing student complaints and food waste.
5.	Business Model (Revenue Model)	* B2B SaaS/License Model: The analytics platform can be licensed directly to universities, higher-education networks, or private student housing chains as a "Wellness-as-a-Service" dashboard tool. * Cafeteria Optimization Services: Revenue can be generated by providing premium, data-driven menu restructuring consultancy to third-party campus catering vendors to help them maximize their profit margins on healthy offerings.
6.	Scalability of the Solution	The architecture is highly scalable. The backend data schema can easily ingest survey and sales datasets from any university, meaning the same Tableau template can be quickly replicated across multiple college campuses or state-wide university systems. Furthermore, it can expand horizontally by integrating real-time cafeteria point-of-sale (POS) transactional logs, tracking how meal habits shift dynamically semester over semester.
